Parts of animal cells

All cells must perform key function to stay alive . For example a cell must take in store, and release energy . It must need to make proteins , release wastes,and recycle materials. A cell must control what comes in and goes out it.

One of the parts is the endoplasmic reticulum is a set folded membranes that works as the cell’s transport system.So if animal did not have endoplasmic reticulum we are not have protein in are cells . It also makes proteins other substances the cell needs.

The cell membrane guards the environment inside the cell. It allows food to enter and wastes to exit . So if animals don't have the cell membrane are cells will not be protected and the cell will fall apart and wastes will going and out .
